

The benefits of hiring professional contractors

The DIY movement has inspired many homeowners to tackle home repair and remodeling projects on their own. DIY projects can be rewarding, and many homeowners who have embraced the DIY movement have discovered talents they never before knew they had.

But no matter how simple popular home renovation television shows make remodeling projects appear, homeowners should know that such undertakings are far more difficult than they appear on television. Homeowners who overestimate their abilities and the time they have

to complete projects can cost themselves substantial amounts of money. In fact, there are a variety of reasons homeowners might want to work with professional contractors when tackling home improvement projects.

Experience

A trial and error approach can work with various projects and problems. But applying such an approach to home improvement projects is risky and potentially dangerous, not to mention costly. Experienced professional contractors with strong track records (seek recommendations from friends or neighbors) won't have to go through trial and error and are therefore more likely than DIYers to complete a project on time and on budget.

Inspiration

One oft-overlooked benefit of working with professional contractors is the likelihood that they can draw up ideas for projects that homeowners might otherwise

never have thought up on their own. Homeowners without specific ideas in mind can ask contractors to come up with various scenarios before committing to a particular one. Veteran contractors can draw on years of experience to create designs that DIYers might be incapable of coming up with and/or incapable of seeing through to completion.

Cost

Conventional wisdom suggests it's less expensive to do something yourself than to hire someone else to do it for you, but that's not necessarily true of home improvement projects. Labor costs typically account for a substantial amount of professionally contracted projects, but homeowners can cut those costs by volunteering to do some of the simpler tasks themselves. In addition, contractors often purchase materials at a much lower cost than individual homeowners because contractors buy

Butterflies and other helpful insects, such as bees, pollinate flowers and can keep dangerous pests at bay in the garden.

Helpful and harmful insects

Although it's virtually impossible to count them, insects are the most diverse group of organisms on the planet. Nine hundred thousand different kinds of insects are known to exist. At any given time, it is estimated that there are around 10 quintillion individual insects living.

Gardeners grow frustrated when seeing their gardens infested with insects. In an effort to restore their gardens, homeowners might be tempted to eradicate any bug that moves in their yards. But gardeners would be wise to first learn which insects are hurting their gardens and which can actually help gardens in the long run.

Harmful

Certain insects can be dangerous to animals and plants. The following are a handful of insects that can threaten the vitality of gardens.

Aphids: These insects suck on the juice needed to sustain plants, particularly when they congregate.

Bald-faced hornet: Hornets tend to be an aggressive species that can sting repeatedly. Should you find a nest near an entertaining space or garden, it can cause trouble.

Carpenter ants: These ants will burrow into wood causing damage. They may compromise any wooden structure in and around a home.

Locusts: Various species of locust can damage plants and crops due to their voracious appetites.

Treehoppers: These small, green insects mimic the look of leaves, and their appetites can affect crops and gardens.

Red pavement ant: As they feed on all manner of human food, these ants can quickly overtake areas with their staggering numbers and deliver painful bites.

Grasshoppers: Certain grasshoppers, like the red-legged grasshopper, can decimate food crops and transfer parasites to birds when eaten as prey.

Caterpillars: Many caterpillars, the precursor to adult moths, will feed constantly on leaves, stems and other parts of plants. The tobacco hornworm moth caterpillar can damage potato and tomato plants.

Multicolored Asian lady beetles

Appearance

Multicolored Asian lady beetles are common throughout most of the United States and parts of Canada. The scientific name is *Harmonia axyridis* (Pallas). This is one of a very large family of beetles known as Coccinellidae. Many people call these beetles "lady-bugs."

Multicolored Asian lady beetles are about 7 mm long. As the name indicates, they occur in a wide spectrum of colors ranging from yellow to orange to red and have a varying number of spots. The variability of appearance in the adults can mislead people to think they are different spe-

cies. A characteristic that assists in their identification is an "M" shaped marked located behind the head.

Behavior, Diet & Habits
There are many species of Coccinellidae in the U.S. and Canada.

Most are beneficial insects. Plant specialists imported several species of lady beetles

into the United States to control crop pests. The adults and larvae of most lady beetles are predators of aphids, mealybugs and scale insects.

In the fall, multicolored Asian lady beetles gather in large numbers on the outside of light-colored houses. As they
